FW: CDB Search Request for 2 month amended Subject:

Imp rtance: High

Hi Chris,

Could you please approve this search request for me? Thanks.

CDB Search Request for 2 month amended

Imp rtance: High

Please do a RUSH search for two month amended case 09/754014, nucleic acids 1-9, 16-22, and 25-45 of SEQ ID NO: 10 against the commercial or interference nucleic acid databases or both. If possible, the search can be limited to noncoding sequences within plasmids.

Thanks very much.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó
                                                                                                                                                                                   Dranch site. It was used as a control for determining which nucleotide within the branchpoint region of herpes simplex virus trucleotide within the branchpoint region of herpes simplex virus type 1 (HSV-1) latency associated transcript (LAT) is the nucleotide charactripts (LAT) is the nucleotide that forms a 2'-5' phosphodisetr bond with the 5' splice donor is site (see AAV64934). The invention relates to methods of stabilising unstable gene transcripts. A claimed polynucleotide comprises: (a) a polynucleotide encoding a gene product: (b) a 5'-sequence of an intron, including the splice donor and splice acceptor sites (see AAV64885 & 1) and (c) a 3'-sequence of the same intron, including a preferred intron is the 2.0 kD LAT of a herpes virus. Methods and compositions using the polynucleotide can be used in gene therapy and more generally as research reagents, an arkers of gene production, in therapeutic or diagnostic compositions, in drug screening and to interest the cell of the cell of

transcripts and proteins in cells in a single recombinational event. The method comprises producing a tagged gene by inserting a DNA sequence. The into an intron of a gene by selecting a DNA sequence having a 5' portion free of any nucleotide sequence selected from AAV43560 and nucleotide sequence selected from AAV43560 and nucleotide sequence selected from AAV43560 and nucleotide sequences identical to a known splice branch site in a known gene, sequences identical to a known spacer region between splice branch and acceptor sites in a known gene, sequences identical to a known gene, sequences identical to a known splice branch and acceptor site in a known gene, sequences identical to a known splice branch and acceptor site in a known gene, sequence identical to a known splice donor site in a known gene, so poen reading frame (ORF) 3N-1 nucleotides in length, the ORF encoding a known peptide tag recognisable to the characteristic of the known peptide tag and sequences selected form CAGG and TAGG. The DNA sequence is inserted intron within the gene to create a tagged gene, and the tagged gene is incubated within the genome of the cell. The method is used for isolating proteins, the first and genes, for analysis of subcellular structures, cellular responses and transcriptional regulation, for the study of viral infection and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

```
This sequence is used in the method of invention for tagging genes, transcripts and proteins in cells in a single recombinational event. The method comprises producing a tagged gene by inserting a DNA sequence into an intron of a gene by selecting a DNA sequence having a 5' portion free of any nucleotide sequence selected from AAV43560 and nucleotide sequences selected from AAV43552 to AAV43560 and nucleotide sequences identical to a known splace branch site in a known spacer region between splice sequences identical in length to a known spacer region between splice branch and acceptor site in a known gene, sequence identical to a known splice acceptor site in a known gene, sequence identical to a known splice branch and acceptor site in a known gene, sequence identical to a known splice donor site in a known gene, an open reading frame (ORF) 3N-1 nucleotides in length, the ORF encoding a known peptide tag recognisable by a known reaction characteristic of the known peptide tag and sequences selected form CAGG and TAGG. The DNA sequence is inserted into the intron within the genome of the cell. The method is used for isolating proteins, within the genome of the cell. The method is used for isolating proteins, and transcriptional regulation, for the study of viral infection and for disease.

```
expression) tags used to identify mRNA transcripts encoding corporated to identify mRNA transcripts encoding fundostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be ESTS (expressed sequence tags) which were previously unknown to be contracted costimulatory factors play an important role in the cytodoxic immune response, particularly against tumour cells. Tumour antigen presentation by T-cell receptors is alone activation of the cytodoxic immune response, particularly against tumour cells, immunostimulatory cofactors also being required insufficient to activate a robust cytotoxic immune response that can insufficient activation of cytodoxic T-lymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, that modulate expression of differentially expressed genes in an about the modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in a superior probes/amplification primers for the dandritic cell capted to abnormal expression of these genes, or of their encoded proteins, can be used in active immunotherapy (or to stimulate the apond them appears to a population of antigen specific effector cells) and vectors containing them are used in gene therapy. Co-administration of vectors containing them are used in gene therapy. Ocadministration of antigen presentation of co-stimulatory factors ensures adequate antigen presentation of encipances and secretion of antigen succession of active containing them are used in gene therapy. Ocadministration of co-stimulatory secretion of co-stimulatory secretion of co-stimulatory containing them are used in gene therapy. Ocadministration of co-stimulatory containing them are used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells).

C tumour fissue (i.e. are upregulated in metastatic breast tumour cells).

AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, contitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell.based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis,

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell comprising a GADE (serial analysis of gene expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M2) for identifying human DMA with a probe which comprises the expression comprising contacting human DMA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a method (M4) for identifying a candidate drug as a candidate drug and monitoring expression in the yeast cell of at least 10 contiguous nucleotides of a NORF gene whose expression as a fected by the calss of drugs. The NORF gene whose expression is a gene candidate drug and monitoring expression in the yeast cell of at least 10 contacting least cell comprising contacting a yeast cell of at least 10 contacting expression in the yeast cell of at least 10 contacting expression in the yeast cell of at least 10 contacting expression in the yeast cell cycle. The methods may be used to identify candidate drugs which the call cycle. The methods may be used to identification of antifungal drugs. ```
The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a cycle captession varies as in M1, where a test substance which modifies the expression varies as in M1, where a test substance which modifies the captession comprising contacting human DNA with a probe which comprises to progression comprising contacting human DNA with a probe which comprises to progression nontiques nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a candidate drug and monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell of at least to NORF gene whose expression is affected by the class of drugs which active candidate drug and monitoring expression in the yeast cell of at least to NORF gene whose expression is affected by the class of drugs which active call cycle, the cell cycle. The methods may be used as markers of phases of the cell cycle. The methods may be used as markers of phases of the cell cycle. The methods may be used as markers of phases of the cell cycle. The methods may be used as markers of phases of the present invention. AAF33262 to AAF33267 represent linkers and PCR to the primers used in the SAGE method, in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Explession of the years game is a constructed and cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 configuous nouleotides of a NORF game whose expression varies as in M1; and (4) a method (44) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is a ffected by the class of drugs. The NORF gene whose expression is a ffected by the class of drugs. The NORF the differentially expressed genes may be used to study, monitor and affect phases of the cell cycle, the methods may be used to smarkers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle -

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag, Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1
                                                                                                                                                                                                           .;

NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAR313CB to AAR44064 represent SAGE tags used in the exemplification of the present invention. AAR33262 to AAR32862 to AAR3286 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle -

at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle and for identification of antifungat drugs. AARF3326 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF3326 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel method for the parallel detection of the methylation status of genomic DNA (I) which involves a (I) sample being treated considerably to convert 5-unmethylated cytosine to uracil. thy and convert 5-unmethylated cytosine to uracil. that of c. then amplifying simultaneously at least 10 different fragments (of fewer than 2 kb) using synthetic oligonucleotide (ON) primers. These primers are based on regulatory, transcribed and/or translated segments present in the sample after chemical treatment. The sequence context of all, or some, of the CpG and CpNpG motifs in the amplified products is then determined. The method is used to detect aberrant methylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Genomic DNA methylation parallel detection associated DNA fragment #147.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Parallel detection of the methylation pattern of many genomic DNA regions, useful for detecting aberrant methylation, includes multiple amplification of chemically modified DNA
                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA methylation; parallel detection; 5-unmethylated cytosine; CpG; CpNpG; amplification; transcription regulation; genetic imprinting; tumorigenesis; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                ;

This invention describes a novel method for the parallel detection of the methylation status of genomic DNA (I) which involves a (I) sample being treated chemically to convert 5-unmethylated cytosine to uracil, thomidine or some other base having hybridization behavior different from that of C, then amplifying simultaneously at least 10 different fragments of fewer than 2 kb) using synthetic oligonucleotide (ON) primers are based on regulatory, transcribed and/or translated segments present in the sample after chemical treatment. The sequence context of all, or some, of the CpG and CpNPG motifs in the amplified products is then determined. The method is used to detect aberrant methylation patterns in the genome, these are implicated in regulation of transcription, genetic imprinting and tumorigenesis. Many target regions in the genome can be analyzed simultaneously and it is not essential to know the sequence context of all targeted regions. Primers may be designed for preferential amplification of particular segments of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for the parallel detection of the methylation status of genomic DNA (1) which involves a (1) sample being treated chemically to convert 5-unmethylated cytosine to uracil, thomidine or some other base having hybridization behavior different from that of C, then amplifying simultaneously at least 10 different fragments of fewer than 2 kb) using synthetic oligonucleotide (N) primers. These primers are based on regulatory, transcribed and/or translated segments present in the sample after chemical treatment. The sequence context of all, or some, of the CpG and CpNPG motifs in the amplified products is then determined. The method is used to detect aberrant methylation patterns in the genome, these are implicated in regulation of transcription, genetic imprinting and tumorigenesis. Many target regions in the genome can be analyzed simultaneously and it is not essential to know the sequence context of all targeted regions. Primers may be interested the enemy of all targeted regions. Primers may be interested the enemy of all targeted regions.
                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genomic DNA methylation parallel detection associated DNA fragment #155.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Parallel detection of the methylation pattern of many genomic DNA regions, useful for detecting aberrant methylation, includes multiple amplification of chemically modified DNA

This invention describes a novel method for the parallel detection of the methylation status of genomic DNA (I) which involves a (I) sample being treated chemically to convert 5-unmethylated cytosine to uracil, thymidine or some other base having hybridization behavior different from that of C, then amplifying simultaneously at least 10 different fragments of fewer than 2 kb) using synthetic oligonucleotide (ON) primers. These primers are based on regulatory, transcribed and/or translated segments present in the sample after chemical treatment. The sequence context of all, or some, of the CpG and CpNpG motifs in the amplified products is then determined. The method is used to detect aberrant methylation patterns in the genome, these are implicated in regulation of transcription, genetic imprinting and tumorigenesis. Many target regions in the genome can be analyzed simultaneously and it is not essential to know the sequence context of all targeted regions. Primers may be designed for preferential amplification of particular segments of interest (e.g. promoters and exons).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                     Genomic DNA methylation parallel detection associated DNA fragment #156.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Parallel detection of the methylation pattern of many genomic DNA regions, useful for detecting aberrant methylation, includes multiple amplification of chemically modified DNA .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The patent describes methods for the preparation of polyamides containing imidazole and pyrrole carboxamides, and also their containing imidazole and pyrrole carboxamides, and also their containing used e.g. for solid phase synthesis of analogues of the di- and tri-N-methylpyrrole carboxamide antiviral antibiotics.

Netropsin and Distamycin A. Materials may be produced which recognise double stranded DNA by interaction with the minor of the DNA. These materials may be used as antiviral, antibacterial and antitumour agents. They may be used double of therapeutic agents. They may be used to bind/cleave double stranded DNA at specific sites using iron and EDTA. The methods give the polyamides and conjugates with high stepwise coupling yields and give highly pure products.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Preparation of poly-pyrrole and poly-imidazole carboxamides production of polyamide-protein and polyamide-oligo:nucleotide conjugates on solid supports
                                                                          Netropsin; Distamycin A analogue; polypyrrole; polyimidazole; carboxamide; polyamide; minor groove binding; oligonucleotide; conjugate; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 7; DB 18; Length 12; 100.0%; Pred. Sequence 2, Application US/08645215
Patent No. 5827686
GENERAL INFORMATION:
APPLICANT: TAMAOKI, TAIKI
APPLICANT: NAKABAYASHI, HIDEKAZU
TITLE OF INVENTION: IMPROVED METHOD OF EXPRESSING GENES IN TITLE OF INVENTION: MAMMALIAN CELLS
NUMBER OF SEQUENCES: 46
CORRESPONDENCE ADDRESSS:
ADDRESSEE: BURNEN, DOONE, SWECKER & MATHIS, L.L.P.
STREET: 699 PRINCE STREET

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         qq
                                                                                   (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qil4732114|qib]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114) plats29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xi10-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114) [plARL29072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli xL10.Gold (Stratagene) cells and selected for amplcillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plasmid inserts

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δλ
                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcse gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil47321H gblAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNN, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          COMMENT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        QQ
                                                                                                                                                                                                      (http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114) [ab] ABA passage of the cost of pWD42 (gil4732114) [ab] ABA passage of pWD42 (gil4732114) [ab] ABA passage of the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for amplicilla resistance."

//note="Vector: PWAZIVY; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qil4732114)pbl.AFL29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AZ476882 23 bp DNA linear GSS 04-0CT-2000 1M0296L02F Mouse 10kb plasmid UUGC1M library Mus musculus genomic clone UUGC1M0296L02 F, DNA sequence.

24 bp DNA linear GSS 29-SEP-2000 1M0004120R Mouse 10kb plasmid UUGCIM library Mus musculus genomic alone UUGCIM0004120 R, DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polynocleotide knase. Adaptor oligonocleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Contact: Robert B.                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                     q
                                                                                                                                                                                                                                                                                                   (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qil4732114) [pl4723012.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GSS 13-DEC-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTAT 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).

of pWD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLI0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       plasmid inserts

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel

electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy_number inductible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicibilin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                              ò
electrophoresis. Vector DNA was prepared from a derivative electrophoresis. Vector DNA was prepared from a derivative of pMA2 (qi147321141gb1AF129072.1), a coopy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptoreton E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymcleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The

adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWDA2 (91147211419b)AR129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           plasmid inserts

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt endr-repaired with T4 DNA polymcrase and T4 polynucleotide kinase. Adaptor oligonucleotides were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GSS 04-OCT-2000

ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 k range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy number inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chanically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /Jab_nost="B. polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into capacity competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TITLE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              VERSION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 qq
```

```
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (git4732114|gb|AE2972.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XLIO-Gold (Stratagene) cells
and selected for ampicillin resistance."

Direct Submission

L Submitted (13-DEC-2000) Sanger Centre, Hinxton, Cambridgeshire,
CB10 15A, UK. Email enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk
On Dec 15, 2000 this sequence version replaced gi:11691506.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence map criteria
as follows. An attempt is made to resolve all sequencing problems,
such as compressions and repeats, but not necessarily within known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AL359205 169434 bp DNA linear PRI 13-DEC-2000 Human DNA sequence from clone RP11-345N16 on chromosome 1, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         annotated repeat sequence elements. Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RPII-345N16 is from the library RPCI-11.2 constructed by the group
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.

NOTE: This is a 'working draft' sequence. It currently consists of 18 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
